How Can You Kill-A-Watt?

If you don't shut your computer down completely at the end of the day, you will leave it suspended between waking and sleeping. This uses energy (quite a bit of it, actually) because the computer has to be kept ready for instant use.

What **you** can do:

- Turn off your computer and monitors at the end of the day.
- For Windows computers
 - Select the Start button, select the Power button, and then select Shut down.
- For Mac computers
 - Choose the Apple menu, and then select Shut Down.
